CSE 331L: Microprocessor Interfacing and Embedded Systems Lab

Summer 2025

Arm Assembly (Part-3)

Class # 04

Recap

- Logical Instruction
- CMP Instruction
- Shift Instruction
- Rotate Instruction
- Arrays

Branch

- What is branch?
- Why branch is used for?

Branch

- What is branch?
  - In ARM Assembly, a branch is an instruction used to change the flow of execution in a program — similar to a jump or goto in high-level languages.
- Why branch is used for?
  - A branch is used in ARM assembly to change the normal sequential flow of execution in a program. It allows the program to jump to another instruction, enabling important programming constructs

Branch types

- Conditional Branch

Editor (Ctrl-E)

Compile and Load (F5) Language: ARMv7

```
1  .global _start
2  .data
3  arr1: .word 1,2,3,4,5,6,7
4
5  .text
6  _start:
7      ldr r0, =arr1
8      mov r3, #7
9      branch1:
10     ldr r1, [r0]
11     add r0,r0,#4
12     cmp r3, #0
13     bne branch1
14
15
```

- Unconditional Branch

Compile and Load (F5) Language: ARMv7

```
1  .global _start
2  .data
3  arr1: .word 1,2,3,4,5,6,7
4
5  .text
6  _start:
7      ldr r0, =arr1
8      branch1:
9      ldr r1, [r0]
10     add r0,r0,#4
11     b branch1
12
```

B (Unconditional Branch)

- Branch causes a branch to a target address

```
B<c> <label>
```

B_ (conditional Branch)

- When the condition is matched, will be executing the branch
- Several types of conditional branches:
  - **BGT**
  - **BLT**
  - **BGE**
  - **BLE**
  - **BEQ**
  - **BNE**
  - **BMI**

Loop

- The branch is actually doing the task of the loop.
- But one thing missing, can you guess?

Counter

- How to implement a counter inside a branch?

Editor (Ctrl-E)

Compile and Load (F5) Language: ARMv7

```
1  .global _start
2  .data
3  arr1: .word 1,2,3,4,5,6,7
4
5  .text
6  _start:
7      ldr r0, =arr1
8      mov r3, #7
9      branch1:
10     ldr r1, [r0]
11     add r0,r0,#4
12     cmp r3, #0
13     bne branch1
14
15
```

Compile and Load (F5) Language: ARMv7

```
1  .global _start
2  .data
3  arr1: .word 1,2,3,4,5,6,7
4
5  .text
6  _start:
7      ldr r0, =arr1
8      mov r3, #7
9      branch1:
10     ldr r1, [r0]
11     add r0,r0,#4
12     sub r3, r3, #1
13     cmp r3, #0
14     bne branch1
15
16
```

BL

- Branch with Link branches to a PC-relative offset, setting the register X30 to PC+4. It provides a hint that this is a subroutine call.

```
BL <label>
```

Referenc

BX

- Branch and Exchange causes a branch to an address and instruction set specified by a register.

```
bx lr
```

Referenc

Why BL and BX

- For making a function call in assembly language
  - Function call uses r0 to r4 GP registers

Code

Compile and Load (F5) Language: ARMv7

```
1  .global _start
2  _start:
3
4      mov r0, #0
5      mov r1, #1
6
7      bl sub_func
8
9
10 sub_func:
11     sub r0, r1, r0
12     bx lr
```

Overwriting values?

- While using function in Assembly, the values of the GP registers can be changed.
- To solve this issue, we need to use **stack**

Solution →

Compile and Load (F5) Language: ARMv7

```
1  .global _start
2  _start:
3
4      mov r0, #0
5      mov r1, #1
6      push { r0, r1}
7      bl sub_func
8      mov r2, r0
9      pop {r0, r1}
10
11 sub_func:
12     sub r0, r1, r0
13     bx lr
```
